Canes

You may find it helpful to use a cane if you have a small problem with balance or instability, some weakness in your leg or trunk, an injury, or pain. If you are elderly, a single point cane may also help you to keep living independently.

Proper Positioning

The top of your cane should reach to the crease in your wrist when you stand up straight. Your elbow should bend a bit when you hold your cane. Hold the cane in the hand opposite the side that needs support.

Walking

When you walk, the cane and your injured leg swing and strike the ground at the same time. To start, position your cane about one small stride ahead and step off on your injured leg. Finish the step with your normal leg.

Stairs

To climb stairs, grasp the handrail (if possible) and step up on your good leg first, with your cane in the hand opposite the injured leg. Then step up on the injured leg. To come down stairs, put your cane on the step first, then your injured leg, and finally the good leg, which carries your body weight.

*Please contact the Rehabilitation Department should you have any questions regarding proper fit and or use of your crutches.
